## Evening Brief

Date: Monday, July 24, 2017

### Weather Summary

All thunderstorms should transition to wet by Tuesday, however thunderstorms will be monitored over the central Idaho Mountains on Tuesday, as these storms, if they develop that far north may be on the drier side.

Drier weather may briefly push into the western/northern side of the Great Basin Wed/Thu, however additional moisture to fuel thunderstorms may quickly return by Friday/Saturday.

### Preparedness Levels

Great Basin	4
National	4

### Great Basin Fire Activity (from Irwin): Heavy Activity

**New Fires and Acres: 47 fires for 9,682 acres. 8,426 acres large fire growth.**

### Resources:

- Crews: 17 T1 IHCs in GB: 15 committed, 1 RR, 1 available.
- T2 IMT Team 4 – Roide is committed to the Missouri Fire.
- GBCC has committed an estimated 112 + type 3, 4, 6 engines.
- 3-T1 and 6-T2 helicopters are available in GACC.
- NW T2 IMT Johnson committed to the Mahogany and Leonard Creek Fires
- T2 IMT Team 6 - Chadwick committed to the Preacher Fire

### Great Basin Fire Potential Summary

Fire danger remains elevated across the west and north under warm and dry conditions. Moisture returning to the Great Basin will bring a decrease in overall fire danger to much of central/eastern Nevada and Utah by the middle of this week.

Fuels continue to moisten across southern and eastern UT, the AZ Strip and parts of Srn NV with the recent trend towards wetter showers and thunderstorms in those areas. ERC's are on the downward trend over these areas, especially UT and the AZ Strip with a more gradual decline over southern NV.

Fine fuels, which have been the main contributor to fire spread early this season in the north and west, will moisten over the next 2 days across much of Nevada and Southern Idaho. Higher than normal fine fuel loading and continuity exists over the northern half of the Great Basin, so these finer fuels will quickly become factor again after a few days of hot/dry weather.

Sagebrush live fuel moisture has been on a rapid downward trend the past few weeks in most areas, finally reaching near to just below normal mid-summer levels across the northern and western portions of the Great Basin. Thus with the live fuels dropping to these levels, combining with the very dry and abundant cured grasses, we have seen increased fire growth and in some cases extreme fire behavior. This is what we have been

warning about for the past several months. Sagebrush live fuel moisture across Central/Srn NV/Utah has dropped significantly to below normal and in some areas is approaching record lows.

ERCs have increased to above the 80th percentile in many areas. The mountains of Central Idaho have seen the most rapid drying of fuels with ERC's also approaching the 90th percentile in a few spots. Ignitions can no quickly turn to large fires, although live fuel moisture in the mountains of Central Idaho can still act as a bit of an inhibitor.

We have issued a Great Basin *Fuels and Fire Behavior Advisory for Nevada and Utah*, available at the following link:

[https://www.predictiveservices.nifc.gov/fuels\\_fire-danger/GB\\_Fuels\\_and\\_Fire\\_Behavior\\_Advisory.pdf](https://www.predictiveservices.nifc.gov/fuels_fire-danger/GB_Fuels_and_Fire_Behavior_Advisory.pdf)
